THE YPS-600

YEAST PROPAGATION SYSTEM

- Uses yeast physiological quirks to grow yeast at the fastest rate possible, enabling the brewer to produce pitch-able quantities in a shorter time than traditional step-by-step procedures.
- Flexible volume, one system can produce 250 to 600 L of concentrated, high vitality yeast. Sufficient for 600HL fermentation depending on yeast strain.
- Recommended starter culture volume, pitch with 5L of inoculant to minimize lab time and labor.
- Flexible usage, fill with hot wort, cool and propagate (recommended). Fill with chilled wort, re-boil and propagate for breweries where brewing and propagation schedules don't align.
- Sterile air supply with flow control to minimize risk of contamination
